Application No.: 10/829,276

**AMENDMENTS TO THE CLAIMS** 

This listing of claims will replace all prior versions and listings of claims in the

application:

LISTING OF CLAIMS:

1. (currently amended): A drawing processing apparatus comprising:

a video input section to which a video data comprising a plurality of frame images is

input;

a drawing input section to which a drawn input image is input;

an image control section for cuttingthat periodically cuts out an a selected image as static

image information from the frame images at intervals of ain a moving image from the moving

image every predetermined time and extracting periodically extracts the drawn input image as

input drawing static information from a drawn input image every at intervals of the

predetermined time;

an image information storage section for storing that stores the static image information in

the moving image cut out by the image control section and the input drawing static information

extracted by the image control section;

an image combining section for combining that combines the static image information in

the moving image and the input drawing static information stored in the image information

storage-section to create combined image information; and

an image drawing section for continuously outputting that outputs the combined image

information, and

a display section that displays the combined image information,

2

Application No.: 10/829,276

when the image control section cuts out a moving image and extracts input drawing static information and when the combined image information is displayed processing time of the drawing processing apparatus, said processing time being a duration starting from a time when the selected image is cut out to a time when the combined image information is displayed on the display section.

- 2. (canceled).
- 3. (original): The drawing processing apparatus according to claim 1, wherein the image drawing section has a function of capturing the combined image information in response to an input of a screen capture signal by an image capture operation of a user.
- 4. (original): The drawing processing apparatus according to claim 1, comprising:
  a moving image storage section for storing a plurality of moving image data; and
  a moving image reproducing section for fetching moving image data selected from the
  moving image data stored in the moving image storage section to reproduce moving images.
- 5. (original): The drawing processing apparatus according to claim 1, wherein the input drawing static information is a set of drawing data represented in a vector format, and

the image combining section combines an image based on the static image information in a moving image stored in the image information storage section with an image shown by the set of drawing data to create combined image information.

. 3

Application No.: 10/829,276

6. (original): The drawing processing apparatus according to claim 5, wherein the drawing data includes data of color, size, points count and a coordinate data set of a drawn input image.

7. (currently amended): A drawing processing method comprising the steps of:

inputting a plurality of frame images;

inputting a drawn input image;

cutting out an image as static image information in a moving image from the moving image;

extracting input drawing static information from a-the drawn input image;

combining the static image information in the moving image obtained by the cutout and the input drawing static information obtained by the extraction to create combined image information; and

outputting and displaying the combined image information,

wherein the cutout of the static image information in the moving image and the extraction of the input drawing static information are <u>periodically</u> repeated <u>every predetermined timeat</u> intervals of a predetermined time,

when the cutout of the static image information of the moving image and the extraction of the input drawing static information are performed and when the combined image information is displayed processing time of a drawings processing apparatus, said processing time being a

Application No.: 10/829,276

duration starting from a time when the image is cut out to a time when the combined image information is displayed.

8. (canceled).

9. (original): The drawing processing method according to claim 7, comprising a step

of:

capturing the combined image information by a screen capture operation.

10. (currently amended): A computer-readable medium encoded with a drawing

processing program, causing a computer to perform:

an image control function of <u>periodically</u> cutting out an image as static image information in a moving image from the moving image <u>every</u> at intervals of a predetermined time and

extracting input drawing static information from a drawn input image every at intervals of the

predetermined time; and

an image combining function of combining the static image information in the moving

image cut out by the image control function and the input drawing static information extracted

by the image control function to create combined image information, and

an outputting and displaying function of outputting and displaying said combined image

information,

wherein the predetermined time is set to be greater than or equal to a processing time of a

drawing processing apparatus, said processing time being a duration starting from a time when

the image is cut out to a time when the combined image information is displayed.

5

Application No.: 10/829,276

11. (currently amended): A teleconference system in which a plurality of participant terminals which participate in a conference are connected through a communication line,

wherein a drawing processing apparatus eomprising comprises:

a video input section to which a video data comprising a plurality of frame images is input;

a drawing input section to which a drawn input image is input;

an image control section for cuttingthat periodically cuts out an a selected image as static image information from the frame images at intervals of ain a moving image from the moving image every predetermined time and extracting periodically extracts the drawn input image as input drawing static information from a drawn input image every at intervals of the predetermined time;

an image information storage section for storingthat stores the static image information in the moving image cut out by the image control section and the input drawing static information extracted by the image control section;

an image combining section for combining that combines the static image information in the moving image and the input drawing static information stored in the image information storage section to create combined image information; and

an image drawing section for continuously outputtingthat outputs the combined image information, and

a display section that displays the combined image information,

Application No.: 10/829,276

is used as the wherein said drawing processing apparatus is one of the plurality of participant terminals.

wherein the predetermined time is set to be greater than or equal to a processing time of the drawing processing apparatus, said processing time being a duration starting from a time when the selected image is cut out to a time when the combined image information is displayed on the display section.

12. (canceled).
